

# Aviation Child Seats

## Aviation seats designed specifically for younger passengers.

Applying several decades of experience in aviation safety and restraint technology, AmSafe® has designed two child seats specifically to be used onboard commercial aircraft – one that reclines and is used on bulkhead tables, and the other for placement on passenger seats.

### Reclining Child Seat

Intended for children under 27.5 lbs (12.5 kg), this innovative seat is simple to assemble and fits securely on the bulkhead table. With two seat positions, the child can either sit-up and view his/her surroundings or sleep comfortably in a reclining position. This compact lightweight child seat can fold flat allowing for space saving stowage. Its removable cover is easy to clean and maintain, and can be customized with the airline's brand.

### Child Passenger Seat

Our child seat is designed for children under 40 lbs (18.14 kg) in weight and is easily positioned in an aviation passenger seat using a standard 2-point seatbelt. It can be used in either a forward- or aft-facing position and contains a familiar harness commonly used on automotive child seats. The lightweight seat can be easily stacked and three seats fit in most overhead bins. It is simple to clean and the padded insert can be customized with the airline's logo.
